

Abstract

A method and system are provided for formatting documents for printing in a selected format and resolution upon determination that the software program generating the print job is incapable of creating a document in the selected layout and at the selected resolution. The process of formatting the document involves causing the software program to generate a print job at a resolution lower than that selected by the user. Images of pages generated by the software program are then formed and printed at a higher resolution, such that the images formed on the printed pages are resized to fit multiple images on one printed page.
